                                                                                                                                                                                                                                                                                                                                                                                                                                                 immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activiny. Inhibin activity, chemotactic/chemokinetic activity, hemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                      1677
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Tang

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinyinhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Wang
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Tang

                                                                                                                                                                                                                                                                                                                                                                                                              nucleic acids can be used to express ORFX proteins in gene therapy vectors. The proteins and nucleic acids may be used to treat cancers, proliferative disorders, neurodegenerative disorders, osteoarthritis, graft vs host disease, cardiovascular disease, diabetes mellitus, hypertension, hypothyroidism, cholesterol ester storage, systemic lupus erythematosus, severe combined immunodeficiency (SCID), AIDS, viral,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antipsoriatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiarthritic; immunosuppressant; immunostimulant; cardiant; thrombolytic; coagulant; vasotropic; antidiabetic; hypotensive; dermatological; immunosuppressive; antiinflammatory; antibacterial; antiviral; antifungal; antirheumatic; antithyroid; and antianaemic. The sequences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an OREX-associated disorder. The presence of the presence of the express OREX profess in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAC74446 to AAC77606 encode the proteins given in AAB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary:

                                                                                                                                                        The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system disease, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activity, inhibit activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inilammation, leukaemias and

                                                                                                                                 The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypnucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as erripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, Activinyinhibin activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and assays for receptor activity, arthritis and inflammation, leukaemias and

The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polya+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-OT primed CDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and fo

                                                                                                                                                                                                                                                                                                                                                                             CC AAZ42265 to AAZ43075 represent novel 5' expressed sequence tag (EST) CC sequences, corresponding to human secreted proteins. AAY46451 to CC AAY65438 represent the EST-related proteins corresponding to AAX42265 to CC AAZ43052. The 5' ESTs can be used for producing secreted human gene CC products. They can be used to identify and isolate 5' untranslated CC regions (UTRs) and upstream regulatory regions which control the CC location, development stage, rate, and quantity of protein synthesis, as CC well as stability of mRNA. The ESTs are also useful as probes for CC chromosome mapping, and to obtain full length cDNA clones. The ESTs can CC also be used in forensic procedures to identify individuals, or in CC diagnostic procedures to identify individuals having genetic diseases CC resulting from abnormal gene expression. The products may also be used in CC used for directing extracellular secretion of a polypeptide or the CC used for directing extracellular secretion of a polypeptide or the CC into a cell. The proteins encoded by the EST sequences may be useful in CC treating a variety of human conditions. Secreted proteins have CC valuable. AAZ42249 to AAZ42264 and AAY664644 to AAY6450 represent XXX sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                      Matches

The present sequence encodes a human protein with hydrophobic domains. CC AAP25173 represents a longer version of the present sequence. The protein possesses a hydrophobic domain and so is a secretory protein CC or a membrane protein. The protein is used as an antigen to prepare antibodies. The polynucleotide sequence is useful as a source of probes CC for genetic diagnosis. It is also useful for producing the protein CC in large quantities and for gene therapy. The enkaryotic cells are used CC for detecting the receptors or ligands corresponding to the protein and CC for detecting small novel pharmaceuticals. The antibodics are also used CC for detection, quantification and purification of the proteins. Both the CC protein and polynucleotide may be used in research or as nutritional CC sources or supplements. The protein may have cytokine and cell CC proliferation/differentiation activity, immune stimulating or suppressing activity hematopoiesis regulating activity, tissue growth activity activity, chemotactic/chemokinetic activity. Hemostatic activity and tumour inhibition activity. It may therefore may be used to treat immune deficiencies resulting from autoimmune disorders or conference in the control of the cont
                                                                                                                                                                                                                                  Query Match

The polynucleotides of the invention are all secreted EST sequences isolated from a variety of human tissue sources. The EST sequences and proteins encoded by them are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haemostatic activity, high activity, the conditions in clivity, themostatic conditions in clivity, the activity, haemostatic and thrombolusion activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New polynucleotides encoding human secreted proteins - derived from e.g. human blood, kidney, foetal lung, placenta, testes, brain, ovary, pituitary, retina and colon cDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Expressed sequence tag; secreted protein; haematopoiesis regulator; tissue growth; activin; inhibin; tumour invasion suppressor; EST; h chemotaxis; chemokinesis, haemostasis; gene therapy; thrombolysis; receptor; ligand; anti-inflammatory; tumour inhibitor; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            AAV86229;

                                                                                                                                                                                                                                                                                                                                        immunosuppressor, haematopoiesis regulating, tissue growth, activin, inhibin, chemotactic, chemokinetic, haemostatic, thrombolytic, receptor/ligand, antiinflammatory or antitumour thrombolytics (no evidence provided). Expression vectors, eukaryotic host cells and antibodies are also provided. The human cDNAs of the invention are used as probes for genetic diagmosis and gene sources for gene therapy, or are used in the recombinant production of the proteins. Cells expressing the secretory or membrane proteins are utilized for detection of corresponding receptors of ligands, and in candidate drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     provides human proteins (see AAB20089-96) having hydrophobic domains indicative of secretory signals and membrane domains, and nucleic acids (see AAF30020-27) encoding them. These are expected to have cell proliferation, cell differentiation, immunostimulant of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of cDNA clone HP10687 encoding a human protein (see AAB20096) having a predicted N-terminal signal peptide. The clone was obtained from a human thymus cDNA library. The predicted protein has a mol.wt. of 23 kDa. The invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Homo sapiens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein secretion; ss

Typically, the 833 bp sequence, or bases 108-833 that encode amino acids -22 to 167 or 1 to 167 of HSP, the latter being the mature protein, is amplified from a clone deposited as ATCC 97455, and recombinant HSP is expressed in e.g. E. coli, insect, mammalian or plant host cells. The HSP (or DNA encoding it in gene therapy) can regulate differentiation and maturation of immune system cells and can thus be used to treat and protect against autoimmune disease, graft rejection, malignant cells and infection by viruses, fungi and bacteria. Fragments of HSP nucleic acids are used as diagnostic probes or primers, e.g. to detect mutalions, or for chromosome identification. Antisense sequences can be used as antagonists of HSP and used to treat or prevent daily and bacteria.

Novel proteins and polypeptides useful for the treatment of e.g multiple sclerosis, systemic lupus erythmatosus, rheumatoid arthritis, cancer, Alzheimer's disease, Parkinson's disease, stroke, anemia and

Claim 24; Page 396; 493pp; English

CC antibiflammatory, antimated by controlled antiparkinsonian, correspondencive, haemostatic, vulnerary, cytostatic, antiparkinsonian, correspondencial, virucide, and fungicide activity. The proteins and controlled antiparkinsonian, virucide, and fungicide activity. The proteins and controlled antiparkinsonian, virucide, and fungicide activity. The proteins and controlled and in research. The proteins are useful for treating immune deficiency cand disorders, which may be genetic or resulting from infections, cardinamune disorders such as multiple sclerosis, systemic lupus could deficiencies such as anaemias by regulating from infections, cardinary and replacement and for treating mycloid or lymphoid continues are also useful in compositions for bone, cardinary, tendon, citissue repair and replacement and in the treatment of wounds, incisions considered in the treatment of control and proteins are also useful in the treatment of control and control and replacement and neuropathies such as Alzheimer's and corrections of diseases and Shy-Drager syndrome, and mechanical and control and corrections and sorders such as spinal cord disorders, head trauma and control control control and control and corrections are useful for treating concert. Other uses for the protein include for inhibiting the growth, cancer. Other uses for the protein anctivity are useful for treating cancer. Other uses for the protein include for inhibiting the growth, control and control and corrected seguences with cadherin activity are useful for treating control and corrections are useful for treating cord disorders, fundi and other parasites, for effecting bodily characteristics controlled and correcteristics or repetition, strange or elimination of distance and cardiac corrects on the trial and correct and corrected and co This invention relates to 59 human secreted proteins and the nucleotide sequences encoding them. Sequences AAC59788-C59846 and AAR34687-B37745 represent the proteins and their encoding nucleotide sequences, and sequences AAB34746-B34771 represent fragments of the proteins. Probes for the DNA sequences are represented by sequences AAC59847-C59596. The proteins exhibit neuroprotective, dermatological, immunosuppressive, processing, ng, utilization, storage or elimination of dietary fat, lipid, carbohydrate, vitamins, minerals, cofactors, effecting ral characteristics, providing analgesic effects and for treat

CC in AAAC7807 to AAC78448 encode the human cancer associated proteins given CC in AAB43398 to AAB4239. The proteins can have activities based on the CC tissues and cells the genes are expressed in Example of activities CC include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiinflammatory; antityroid; antiallergic; antibacterial; antiviral; CC dermatological; neuroprotective; cardiant; thrombolytic; coagulant; CC nootropic; vasotropic; antipsoriatic and antiangiogenic. The CC polynucleotides and polypeptides can be used for preventing, treating or CC meliorating medical conditions and diagnosing pathological conditions. CC polynucleotides, polypeptides, antibodies, agonists and antagonists from CC immune cells, to treat disorders of haematopoietic cells, autoimmune CC disorders, allergic reactions, graft versus host disease and organ CC rejection, modulate haemostatic or thrombolytic activity, modulate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 847
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   diagnosis; cytostatic; próliferative; vulnérary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiviral; antiinflammatory; antihyroid; antiallergic; antibacterial; cardiant; dermatological; neuroprotective; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic; antianglogenic; gene therapy; inflammation; vasotropic; antipsoriatic; antianglogenic; gene therapy; inflammation;

Khol; cDNA was prepared from 2ug of poly A+ RNA.

RCORT-Xhol cut cDNA was then ligated into Unizap-XR (Stratagene) with EcoRI at the 5' end and Xhol at the 3' end. SS-library phagemids were prepared by mass excision from the original library and normalized by hybridization to biothnylated driver (prepared from the same library by PCR) to Cot-omega of 11. After removal of hybrids and excess driver by streptavidin sephacose chromatography, the SS-phagemids were made double stranded and electroporated into Top-10 F'. Original library contruction by Bruce Blumberg (Blumberg et al., 1991 Science 253, 194-196; Hawlet et al., 1995, Genes Dev. 9, 2923-2935). Normalized by Jihwan Song (Song, Cho and Blumberg) unpublished). Note: This is a Xenopus Gene Collection (XGC) library.

/note="Organ: lung, Vector: pT773D-pac (Pharmacia) with a modified polylinker: 1st strand cDNA was prepared from modified polylinker: 1st strand cDNA was prepared from neuroendocrine lung carcinoid, and was then primed with a not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco R1 adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco R1 sites of the modified pT773 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. "
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     1 (bases 1 to 497)

//acce-most-masses modely vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; Equal amounts of plasmid DNA from three normalized libraries (fetal lung NHLL19W, testis NHT, and B-cell lung NHLL19W, testis NHT, and B-cell vitro. Following HAP purification, this DNA was used as tracer in a subtractive hybridization. The driver was PCR-amplified CDNAs from pools of 5,000 clones made from the same 3 libraries. The pools consisted of I.M.A.G.E. clones 294480-302087, 682632-687239, 726409-728711, and 729096-731399. Subtraction by Bento Soares and M. Fallma Bonaldo.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence contained an oligo-dT track that was present in the oligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NoLI site and the oligo-dT track served to verify it as a clone from the normalized uterus library properation. M.B. Consensus quality: 8632 bases at least Q20
Consensus quality: 8632 bases at least Q20
Estimated insert size: 86910; pulse field gel estimation
Duality coverage: 6.4 in Q20 bases; pulse field gel estimation

* NOTE: This is a 'working draft' sequence. It currently

* consists of I contigs. Gaps between the contigs estimation.

* is believed to be correct as given, however the pieces

* of the gaps between them are based on estimates that have

* provided by the submittor.

* This sequence will be replaced

* by the finished sequence as soon as it is available and

* the accession number will be preserved.

* Totalis will be contig of 86914 bp in length.

* NOTE: This Is a "working draft' sequence. It currently
consists of 26 contigs. The true order of the places

* snot known and their order in this sequence record is
arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.

* NOTE: This is a "working draft' sequence. It currently

* consists of 29 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gapes are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.
